

Contacts Database Version 2

This is an enhanced version of the example DBF AddressBook application that comes with Lazarus. It has a simple search facility, a previously used file option and uses LazReport to show either a single contact or the entire contact list before printing.

Before you load the source project into Lazarus please ensure that you have installed version 1.2.6 of Lazarus as well as the lazreport, lazmrmenu and rx packages into the IDE.

Contacts could also benefit from exporting the list to a CSV file. This may happen in the future, but I have other priorities at the moment.
